

## LANDING GEAR

The illustration above is a sectional view of Tripod Landing Gear No. 2. This is the main landing gear access/egress port located between the laboratory and galley. A small control panel on the wall of the companion-way will allow the floor panel to slide back. The door at the end will automatically slide open so that the floor hatch may tilt up. A control panel located outside will also open/close the hatch. Two other landing gear exits are available, one through the engine room and an emergency exit through the bath. All tripod hatches function the same, the landing gear is lowered from the control room by the tripod control panel (pictured at right.)
